

The New Standard in Lighting for Health Care

Does your hospital or health care facility use CFL, fluorescent or HID lighting?
Now you can install the Ultra-High Efficiency—100% mercury free LED lighting in your facility.

LED DOWN LIGHT

More and more hospital and patient care facilities have been complying with the **2006 AIA Guidelines** for Design and Construction of Hospital and Health Care Facilities that requires the elimination of mercury from their fluorescent, CFL, HID and other lighting applications. Their recommendations to use LED lighting is not only safe and toxic free...but it's also socially responsible.

Why use L.E.D. lights?

- ✓ They are SAFE! No mercury or toxic chemicals like the CFL's, and are 100% recyclable.
- ✓ They use only 10% of the energy of an incandescent bulb; — one 65 watt bulb uses about \$59 of electricity each year, an L.E.D. bulb \$6.
- ✓ They're dimmable and come in all the brightness, soft light, daylight, etc.
- ✓ They last for 20 years or more & are the most energy efficient light anywhere
- ✓ They use about half of the energy of a CFL bulb.
- ✓ CFL's contain mercury and cannot be put in the trash, and last only 2-5 years.
- ✓ They are UL Approved, Energy Star and RoHS Compliant.
- ✓ L.E.D. lights run cooler...saves on air conditioning costs.

Hospitals and healthcare facilities can finally be *mercury free* in all of their lighting due to the advancement in L.E.D. lighting. The hazards concerning the breakage and mercury contamination of Fluorescent, CFL's, U-bent lamps is no longer an issue...once the New L.E.D. bulbs are installed!

We are the exclusive regional distributor for the Enlux L.E.D. lighting line and can provide you with advice, installation, retrofitting, and guidance for any application!

Recommendations according to AIA 2006 guidelines for Hospitals and Healthcare:
"Reduce Mercury in the facility by specifying LED lamps..."
